CUMULATIVE FERTILITY WOMEN BORN 1893 TO 1953

This paper supersedes Cumulative Fertility Rates 1908-1965 issued June 1967.

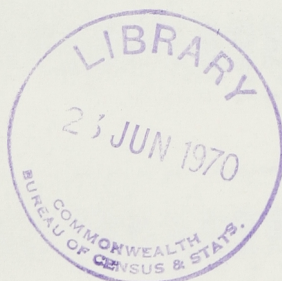

The cumulative fertility rates given in the attached tables are based upon the single-age-specific rates 1921 to 1968 in Age-Specific Fertility 1921 to 1968 published in April 1970 and upon rates calculated for the years 1908 to 1920 using population estimates published in M. J. Holmes, Cancer Mortality in Australia, Commonwealth of Australia, Department of Health, Service Publication No.30, 1925.

The tables show the cumulated fertility for the survivors of women born in each year from 1893 at each exact age from 16 to 50. The latest birth years are, of course, incomplete. The cumulated rates at age 50, represent the total fertility, according to year of birth, of women who survived to the end of their reproductive life. No adjustment has been attempted for possible differential fertility of the women who dropped out through death or emigration or of those who were added as a result of immigration.
